

ABSTRACT OF THE DISCLOSURE

A method of dispensing a food product composed of a plurality of ingredients which are mixed to form the food product, includes the steps of providing a rotary surface having a rotary axis and a periphery, mixing together first and second fluid ingredients to
5 form a liquid product mix, depositing the liquid product mix onto the surface while rotating the surface so that the liquid product mix spreads out on the surface in a layer, cooling the surface to a temperature low enough to at least partially freeze said layer to form a frozen product body, removing the product body from the surface as product body scrapings, and collecting and compacting the scrapings to form the food product.
